AesthetiDiagnose

A local AI assistant that drafts aesthetic pre-consultation letters for the surgeon to review

Kaouther Blibech, PhD

01 · THE PROBLEM

Every patient request needs a long, personal letter from the surgeon

1

Long to write

Four to five paragraphs that combine the photos, the medical history and the feasibility of each procedure.

2

Patients wait

Writing competes with consultations and surgery, so answers are delayed and patients compare other clinics.

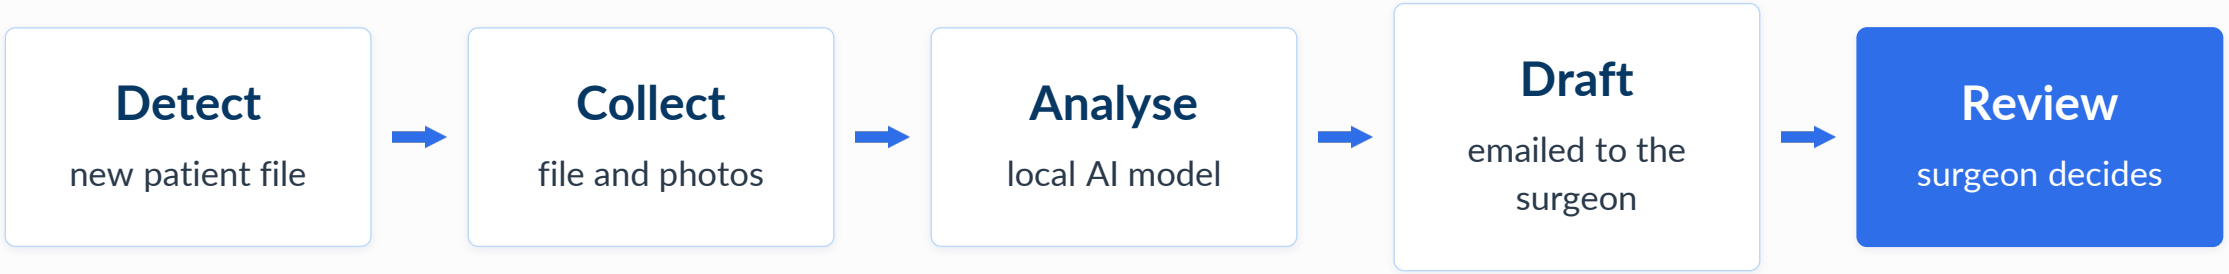

3

Too sensitive for public AI

Face and body photos with health data cannot be pasted into a public chatbot.

02 · THE SOLUTION

AestheticDiagnose drafts the letter locally; the surgeon decides

Gemma 4 12B vision model

n8n + Ollama in Docker

One 8 GB GPU

No cloud API

03 · THE MVP

From a new patient file to a draft in the surgeon's inbox

Demo recording

Replace this area with the screen capture in the video editor

1. A file is assigned to a surgeon
2. Photos and file are analysed on the local GPU
3. A draft in the surgeon's voice arrives by email

04 · VALIDATION

13 of 17 drafts were correct on real patient files

76%

of drafts judged correct by expert review

21 real files tested · 17 with photos all processed · 4 without photos correctly skipped

Next: an automatic checker with retry, aiming for 95%

⚠ What failed, and why it is fixable

Cut-off letters	2
Invented visual detail	1
Wrong age	1

05 · LEARNINGS

Checking matters more than generating

1

Small and local is enough

A 12B model on an 8 GB GPU did real professional work without giving up privacy.

2

No checker, no trust

Every failure looked fine at a glance. Automatic checks must come before any unattended use.

3

The expert role shifts

The surgeon moves from writing to reviewing and deciding, where expertise matters most.

✓ **AI drafts. The surgeon decides.**
